ABSTRACT (Continue on reverse side if necessary and identify by block number) <b>Results of the water rights inventory in the proposed MX siting area of Utah and Nevada show that the acquisition of a legal water right is divided into three steps: the application to establish a date of priority; a permit to allow the power to proceed; and a certificate establishing the legal status of a water right, in most valley areas. The work done is much less than the water rights in the valley.</b>		

## FOREWORD

This report was prepared as part of the MX Water Resources Program for the Ballistic Missile Office (BMO) in compliance with Contract No. F04704-80-C-0006, CDRL Item 004A2. It includes a summary of the Phase II Legal Study, consisting of a water rights inventory of the Nevada-Utah siting area conducted for Fugro National by the Desert Research Institute (DRI). Included as Appendix A is the entire DRI report titled, "Water Rights in Nevada and Utah: An Inventory Within the MX Area."

Phase I of the Legal Study, also prepared by DRI, was submitted by Fugro National, Inc. to the BMO in February 1980 and was revised in June 1980. The Phase I report is an overview of Nevada and Utah water law including historical development and current procedures for water rights acquisition.

A	Water Rights In Nevada and Utah: An Inventory Within the MX Area
---	---

## 1.0 INTRODUCTION

The management and future development of water supplies in Nevada and Utah is under the jurisdiction of the respective state engineer. To define the current water laws, appropriation procedures, and existing water appropriations in the proposed MX siting valleys, a two-phase legal study was initiated. These studies were conducted for Fugro National by the Desert Research Institute (DRI) in Nevada. The Phase I study included both an overview of the development of water law and rights in Nevada and Utah and a discussion of the step-by-step procedures for water appropriation in the two states. The Phase II study, summarized herein, was conducted to determine all water right owners of record within the MX area and to determine the extent of those water rights. The study included an estimate of the total quantity of water currently appropriated within the MX siting area, along with estimates of the available water supply.

The Phase II study was compiled from records maintained by the state engineer offices in Nevada and Utah. Data from the inventory were compiled for the siting valleys in Nevada and Utah and tabulated in accordance with the legal status of each water appropriation during the compilation period (December 1979 to March 1980). During the study, a total of 3476 water right files were examined in Nevada and 1884 in Utah.

Although the study has not been certified, approved, or agreed to by either the state engineer of Nevada or Utah, it is considered to be the most thorough and accurate study of its kind

to date and it represents an appropriate data base for water resources planning in the area.

## 2.0 RESULTS AND CONCLUSIONS

Results of the Phase II study are summarized in Table 1, which lists water appropriation data by valley according to source of the water supply and legal status of the water appropriations. Although precise terminology varies slightly between the two states, in general, the acquisition of a legal water right is divided into the following three steps:

1. An Application: This establishes a date of priority, and it may be either approved, rejected, under protest, rejected and under appeal, or withheld pending further study;
2. A Permit: This allows the party to proceed with an approved application under conditions prescribed by the approval; and
3. A Certificate: This establishes the legal status of a water right.

The certificate is, therefore, the legal water right.

For water that was in use at the time the water law was first enacted (vested rights), a different procedure is used. These users file a Proof of Appropriation which claims that a certain amount of water has historically been used. The actual vested water right must then be determined by adjudication.

The water rights information, shown in Table 1, is grouped according to: 1) applications and permits, and 2) proofs (of appropriation) and certificates. The rationale for this grouping is as follows:

- A. Neither an application nor a permit represents a perfected water right. However, an application does establish a priority date in time and, should it be approved and all conditions met, could eventually become a valid water right. The permit (or approved application) represents an intermediate stage of somewhat more substance in that the applicant has authority to proceed with those steps necessary for perfecting the water right.

  8. INCLUDES PLEASANT VALLEY.
  9. INCLUDES HAMLIN VALLEY.
  10. HYDROGRAPHIC BASIN WHICH INCLUDES PAHROC VALLEY.
  11. INCLUDED IN VALLEY ESTIMATE FOR NEVADA.
  12. INCLUDES DRY LAKE SUBAREA. (SEVIER/WHIRLWIND)
  13. AVERAGE OF REPORTED RANGE.
- MINOR: MINOR QUANTITY, EITHER LESS THAN 500 ACRE - FEET (0.62 hm<sup>3</sup>) PER YEAR, OR SMALL COMPARED TO OTHER QUANTITIES IN THE HYDROGRAPHIC AREA.
- NOTE: BASED ON COMMUNICATIONS WITH THE DESERT RESEARCH INSTITUTE, SOME CERTIFICATES AND PROOF NUMBERS WERE REVISED FROM THOSE APPEARING IN APPENDIX A.

- B. For vested rights, a "proof" may or may not represent a more substantial "water right" than a permit or approved application. However, the proof does represent a claim to historical water use, the legal extent of which must be established through adjudication, and, until such time as adjudication is completed, the claimed usage stands in the records. Thus, for summary purposes, proofs were included with fully certificated legal water rights.

As shown in Table 1, the aggregate ground-water- and surface-water-annual use represented by applications, permits, and proofs and certificates total 2,623,731 acre-ft/yr; the total of surface runoff and perennial ground-water yield in the MX siting area is greater than 1,285,200 acre-ft/yr ( $>503,700$  acre-ft/yr surface runoff + about 781,500 acre-ft/yr ground-water perennial yield). If all applications and permits outstanding were to proceed to the certificate stage and if all proofs were to be adjudicated to the claimed use, most of the individual basins would be over appropriated. However, this is very unlikely. In Nevada, for example, about half of the applications that have been filed since filing procedures began in 1905, have been filed within the last four or five years in conjunction with applications under the Carey and Desert Land Entry acts. As such, they are being held in a "Ready for Action" status by the Nevada State Engineer pending release of those lands from the public domain. However, the aggregate total of estimated surface runoff and ground-water perennial yield greatly exceeds the total quantity of surface and ground-water certificates and proofs.

Surface runoff estimates presented in the table are based on precipitation and basin topographic data. As such, they include

all perennial, intermittent, and ephemeral streamflow. However, only perennial and intermittent streams that are supplied by base flow over a significant portion of the year, are likely to be economically recoverable. Therefore, although estimated surface runoff in Nevada exceeds the amount of total surface water applications and appropriations, recoverable surface water is nearly or totally utilized in all basins. This conclusion agrees with surface-water field reconnaissance studies performed by Fugro National. It is anticipated, therefore, that ground water will supply nearly all MX water requirements except where it can be augmented by lease or purchase of surface-water and spring-discharge water rights.

Ground-water rights data summarized in Table 1 indicate that the total amount of ground-water rights in all stages of application and appropriation exceeds the perennial yield in most valleys. As shown, the majority of these rights are in the permits and applications phase; certificates and proofs generally represent less than the perennial ground-water yield in each valley. However, these rights are not static but dynamic. On a daily basis, new applications are received, permits are issued, various proofs are filed, certificates are granted; water rights are bought, leased, or abandoned; and points and manner of diversion and use are changed. Because of the dynamics in the states' water-rights appropriation system it is extremely difficult to determine the exact status of all water rights at any given time. This is especially true with permits which allow the applicant to proceed with diversion of water. In that case, a

certificate is issued after development of a water source only if the development was in accordance with the law and provisions in the permit. However, no attempt is made to update files as to the developmental status between the period a permit is granted and a certificate is issued.

In general, unappropriated ground water is available in basins not "designated" by the state engineer in Nevada or "closed" to further appropriation by the state engineer in Utah. Basins are "designated" by the Nevada State Engineer when the amount of ground water appropriated nears or exceeds the perennial yield. In these areas further appropriations will be considered by the state engineer based on duration, amount, and type of use. In basins "closed" by the Utah State Engineer, further applications for appropriation are generally not being considered.

Although the water rights inventory report does not include any data on specific individual water rights, data on actual ownership and locations of points of diversion and use are contained in a set of working files, one file for each basin. A complete set of these files has been transmitted separately to Fugro National as a supplement to the inventory report.

The water rights inventory is valuable in determining where unappropriated ground water is currently available, identifying potential lessors of ground water; making a preliminary evaluation of the potential for acquiring water from present users either by purchase or lease; and determining whether an effort should be made to file for a new ground-water right for

available unappropriated waters. In the evaluation of present ground-water availability, this inventory should be used in conjunction with the Industry Activity Inventories which include estimates of actual water use in each basin. In most valley areas, the actual water use is considerably less than the ground-water rights associated with all Certificates and Proofs within the valley. The Industry Activity Inventory reports were prepared by the Desert Research Institute and the Utah Water Research Laboratory for Nevada and Utah, respectively. Both reports were submitted to the Ballistic Missile Office under the same cover on 2 September 1980.

# **DISCLAIMER**

This water rights inventory summary has not been certified, approved or agreed to by either the State Engineer of Nevada or the State Engineer of Utah or any other agency of either state. All assumptions, interpretations, inferences, conclusions and tabulations are the sole responsibility of the Desert Research Institute.

## ACKNOWLEDGEMENT

This inventory could not have been completed without the gracious assistance and advice of personnel in the State Engineer's Offices of Nevada and Utah who guided the DRI personnel through the mazes of water rights records in those offices. They also provided us with access to reports and other documents, and provided us with commentary as to their office procedures and the procedures we were using to analyze the water rights information.

## SUMMARY AND CONCLUSIONS

During the period from mid-December 1979 to late February 1980 an examination was made of the water rights records of the State Engineer of Nevada to determine water right owners of record within the MX area and to determine the extent of those rights. Inventory was accomplished according to legal status of "water rights" i.e. Application to Appropriate (not a water right), Permit to Appropriate (not a water right), Proof of Appropriation (a claimed vested water right) and Certificate (a legal water right). For purposes of this summary report these were grouped as "Permits and Applications" and "Certificates and Proofs". Section II of this report summarizes these "water rights" for 44 individual hydrographic basins together with estimated hydrologic data. The basin summaries are presented according to source of water (ground or surface), type of ownership and type of use. For some basins supplementary explanatory notes are also provided.

Water right records of the State Engineer of Utah were examined for the same purposes during January 1980 and again in March 1980. Comparable legal status classifications were used to summarize the Utah information which is presented in the tabulations of Section II under the same group headings as used for Nevada, i.e. "Permits and Applications" and "Certificates and Proofs".

The Nevada and Utah water rights data inventoried are summarized in Table 1 by hydrographic basin according to source of water and water right legal status. Also shown is estimated water availability. All these data are for annual use expressed in acre-feet per year.

The data examined in Nevada represent a total of approximately 3476 water right files and in Utah approximately 1834 water right files. In Nevada approximately 1581 files fall in the "Permit and Applications" category and approximately 1895 are in the "Certificate and Proof" category. In Utah the category totals are respectively 1065 and 819.

(1) Average of reported range.											

(1) Average of reported range.

There are two components missing from the Nevada water rights inventory. The first of these are private domestic wells, which under Nevada law are not required to have a permit. The number of domestic wells in the inventory area is unknown. While the aggregate annual water taken by domestic wells is not believed to be significant, interference with those wells by new water diversions could be a relatively serious problem - especially for the well owners. The second component consists of vested rights for which a Proof of Appropriation has never been filed, or the claim was filed at an early date in the county courthouse but never with the State Engineer. No attempt was made to inventory unfiled claims. A check was made in the Lincoln County Courthouse records and some claims were located, but a complete inventory was not made. It is believed that while many claims exist in the courthouses they primarily represent small spring flows and the aggregate quantity of water involved is relatively small. This belief is also held by personnel in the Nevada State Engineer's Office.

No attempt was made to determine whether any unfiled Diligence Claims existed in Utah. Domestic wells, however, are included.

This report does not include any data on specific individual water rights. Data on actual ownership and locations of points of diversion and use are contained in a set of working files - one file for each basin. A complete set of these files is being transmitted separately to Fugro National as a supplement to this report. With regard to data in working files several points must be made:

1. Ownership is listed as found in the latest record available in the State Engineer's Offices and no attempt was made to develop assignment histories. Furthermore many addresses are incomplete or out of date, but again no attempt was made to either complete or update them.
2. No attempt was made to determine whether applications had been made or approved for changes in type of use, place or use or point of diversion.

3. In cases where records were incomplete no attempt was made to complete those records by investigating other data sources other than as is explained in Section I of this report.
4. The "Basin Abstract" forms provided in each working file represent a first distillation of the raw data found in the State Engineer's Offices. For the Utah files copies of some of the raw data are included.

This entire water rights inventory project represents work done by faculty of the Desert Research Institute. All assumptions, interpretations, inferences, conclusions, and tabulations are their's alone and do not in any token represent a certification, approval or agreement by either the State Engineer of Nevada or the State Engineer of Utah or any other agency of either state.

## SECTION I

### PROCEDURES AND COMMENTARY

#### INTRODUCTION

A major concern expressed by many Nevada and Utah residents about the MX System has been that of water requirements and water rights. Given that both states are arid, water availability has played a significant role in how and where economic development has occurred. The scarcity and variability of occurrence of water in both states lead each to adopt the "Appropriative Doctrine" of water rights. Development and application of water law in Nevada and Utah were discussed at length in a report on the first phase of this project.<sup>1</sup>

At the time that the proposal was made to undertake a "comprehensive" survey of water rights within the Nevada and Utah MX area, it was the investigators' perception that there was a relatively small and manageable number of rights involved. However, in Nevada, instead of finding a small handful or so of "rights" in each valley, as many as 390 in a single valley were encountered. In Utah that number approached 1500 in the Delta area. Because of the large number of "water rights" in the MX area and the limited time and financial resources with which conduct the inventory, it is less than comprehensive in nature. However, the inventory is thorough and relatively accurate and thus should be useful as a planning resource. Weaknesses and strengths of the inventory are discussed in the following sections.

#### DEFINITIONS AND ORGANIZATION

##### Definition of "Water Rights"

For lack of a better term, "water right" is being used here for discussion purposes to encompass a spectrum of distinct steps or circumstances involved with the legal acquisition of the property right in Nevada and Utah known as "a water right".

---

<sup>1</sup> Bird, J.W. and G.F. Cochran, 1979, "Overview of Nevada and Utah Water Law: Historical Development and Current Procedures for Rights Acquisition", Water Resources Center, Desert Research Institute, Reno, NV.

Under the Nevada law, for water rights acquired subsequent to passage of the law, the first step is to submit an Application. This establishes a priority date and if the application is approved, a Permit may be issued which allows proceeding with diversion of the water. If the water is developed in accordance with the law and provisions in the permit then a Certificate is issued. This certificate is the legal water right. For water that was in use at the time the water law was passed (vested rights) a different procedure is used. These users file a Proof of Appropriation which claims that a certain amount of water has historically been used. The actual vested water right must then be determined by adjudication.

In Utah the situation is very similar though some of the terminology is slightly different e.g. a Nevada "Proof" and a Utah "Diligence Claim" both relate to vested rights.

In both the Nevada and Utah State Engineer Offices when a party makes application to appropriate water a permanent file is created. The contents of that file change with time as the applicant proceeds with development of the legal water right. With vested rights the file is initiated by submission of the Proof or Diligence Claim. Thus at any given instant in time the State Engineers' records are composed of files that may contain among other documents:

1. An Application: That may: be pending further action; have been approved; have been rejected; be under protest; have been rejected and is under appeal, etc.
2. A Permit: that allows the party to proceed with an approved application under conditions prescribed with the approval.
3. A Proof: that claims historical beneficial use or vested rights (Diligence Claim in Utah).
4. A Certificate: that establishes the legal status of "a water right".

To effect a summary of the water rights inventory the above four items were grouped as 1) Applications and Permits, and 2) Proofs (of appropriation) and Certificates. Rationale for this grouping was as follows:

- A. Neither an application nor a permit represents a perfected water right. However, an Application does establish a priority date and should it be approved and all conditions be met, could eventually become a valid water right. The Permit (or Approved Application) represents an intermediate stage of somewhat more substance in that the applicant has authority to proceed with those steps necessary for perfecting the water right.
- B. For vested rights a "Proof" may or may not represent a more substantial "water right" than a Permit or Approved Application. However, the Proof does represent a claim to historical water use, the legal extent of which must be established through adjudication, and until such time as adjudication is completed the claimed usage stands in the records. Thus, for summary purposes, Proofs were included with fully Certificated legal water rights.

Since neither the Nevada or Utah water right records are in a computerized data storage and retrieval system, and given the number of water right files, the time constraints for this project, and financial limitations, it was impossible to develop any more refined legal status than represented by these two categories.

#### Study Area and Subdivisions

The area for which water rights were inventoried was defined on the basis of a map provided by Fugro National to Desert Research in October 1979. Within Nevada the study boundaries were broadened to include the entirety of each hydrographic basin of which any portion was included within the MX boundaries. The MX boundaries, as provided by Fugro National, and the Nevada study region are shown here on Plate I.

Summary of all Nevada water rights was done on a basin by basin basis. The basin numbers and names are those defined on the Nevada State Hydrographic Basin Map as published by the Nevada Department of Conservation and Natural Resources. The Nevada State Engineer's Office uses these same basin numbers and names to summarize and organize water right records. All the Nevada basins are coincident with those defined in USGS Professional Paper 813G.<sup>1</sup> The Nevada basins for which inventories have been prepared are listed in Table 2 together with an indication of those basins that have been "designated" under provisions of the Nevada water law. The "designated" status provides the State Engineer with additional authorities in managing water resources of the basin.

In Utah definition of summary units was a little more difficult. To maintain hydrologic consistency for both states it was decided to utilize the hydrographic basins as defined in USGS Professional Paper 813-G. These basins do not have one-to-one correspondence to "water right areas" as defined and utilized by the Utah State Engineer's Office. The USGS hydrographic basins in Utah are shown on Plate II with the MX boundaries as provided by Fugro National. Table 3 lists the basin names and numbers with current restrictions and Utah area designations. Using the hydrographic basin approach provided hydrologic consistency, but complicated the inventory process by requiring a geographic check on each "water right". Some errors may have been introduced in this process but they are not believed to be significant.

More importantly, in Utah only those portions of each hydrographic basin included within the MX area as defined in Plate II were inventoried. Time and funds precluded using the broader approach as used in Nevada.

#### Organization of Summary

The summary inventory tables included in Section II of this report are organized by hydrographic basin. Within each basin there are four components:

<sup>1</sup> Eakin, T.E., D. Price and J.R. Harrill, 1976, "Summary Appraisals of the Nation's Ground-Water Resources - Great Basin Region", U.S. Geological Survey Prof. Paper 813-G, USGPO, Washington, D.C.

14. Hamlin Valley	19	U-196

(1) Hydrographic Basin numbers are those defined in USGS Professional Paper 813-G.

(2) Areas defined by the Utah State Engineer for administratively processing and filing water rights.

(3) Permits to pump groundwater either not being issued, being issued with limitations, or being issued for preferred purposes only (as of 1973).

(4) Permits to pump additional groundwater are subject to priorities of existing surface water uses (true in all areas but highly pertinent here).

1. Hydrologic Summary: This represents the best available estimates of water supply as published in various documents. Sources for the estimates are noted.
2. Water Rights by Legal Status: This summary presents separately the "water rights" to surface water and groundwater for each of the two classifications. For each "right" class the number of "rights", the total diversion rate in cubic feet per second and the annual use in acre-feet per year are given.
3. Water Rights by Ownership: This summary presents the combined Application, Permit, Certificate and Proof data for groundwater and surface water for each of six (6) ownership categories. Included are the number of "rights", diversion rate and annual use.
4. Water Rights by Type of Use: This summary is similar to that for Ownership, but instead displays the data in terms of eight (8) use categories.

## DATA SOURCES AND ACQUISITION

### Hydrologic Data

For each hydrographic basin an attempt was made to provide estimates of five hydrologic parameters:

1. Annual Surface Water Runoff,
2. Annual Natural Groundwater Recharge,
3. Annual Natural Groundwater Discharge
4. Perennial Groundwater Yield, and
5. Transitional Storage Reserve

The first parameter is an indication of the streamflow potentially available. The second and third parameters (recharge and discharge) taken together are an indication of the "goodness" of a basin's water budget which in turn is reflected in the fourth

parameter, Perennial Yield. The fifth parameter, Transitional Storage Reserve (TSR), is an estimate of how much groundwater must be removed from storage to develop the Perennial Yield.

Transitional Storage Reserve was defined by Worts as:<sup>1</sup>

"... the quantity of water in storage in a particular ground-water reservoir that can be extracted and beneficially used during the transition period between equilibrium conditions in a state of nature and new equilibrium conditions under the perennial-yield concept of ground-water development. In the arid environment of the Great Basin, the transitional storage reserve of such a reservoir is the amount of stored water available for withdrawal by pumping during the nonequilibrium period of development, or period of lowering water levels. Obviously, transitional storage reserve is a specific part of the total ground-water resource that can be taken from storage; it is water that is available in addition to the recharge."

For Nevada the primary sources of data were reports in the "Water Resources Reconnaissance Series" as published by the Nevada State Engineers Office. These reports were supplemented by "Water Resources Bulletins" and "Water Resources Planning Reports" also published by that office. Each hydrologic summary lists by code the specific data source(s), e.g. B41, B35, WPR3. A complete list of codes and report titles are presented following the basin summaries.

For Utah the primary data sources were USGS Professional Paper 813-G and the State of Utah Department of Natural Resources Technical Publications. Few Technical Publications have been completed in the MX area and thus the Utah hydrologic data are not as complete as for Nevada (see Appendix).

---

<sup>1</sup>Worts, G.F., 1967, "The Available Water Supply" in Rush, R.E. and P.A. Glancy, "Water-resource Appraisal of the Warm Springs, Lemmon Valley Area, Washoe County, Nevada", Nevada Dept. Cons. and Nat. Res., Water Resources-Reconnaissance Ser. Rpt. 43, p. 48-53.

Not all of the hydrologic parameters were available for all the basins. However, because of project limitations no attempt was made to provide independent estimates for the missing parameters. A great deal more hydrologic data exist in the source documents, but it is difficult to summarize briefly. Additionally, the TSR parameter was introduced into the Nevada Reconnaissance Series in Report No. 43 and thus was not available for basins covered by earlier reports. Related data, i.e. volume of groundwater in storage per foot of saturated sediment, are available but were not included because there is not a one-to-one conversion to the TSR concept.

The authors of this inventory deliberately have avoided drawing any independent hydrologic conclusions or making any hydrologic inferences for any basin. We have simply reported the conclusions and inferences of others and as such take no stand as to the adequacy, completeness or correctness of the studies that led to those numbers.

### Water Rights Data

#### Nevada

All the Nevada water rights data were compiled from records maintained by the Office of State Engineer, Nevada Division of Water Resources in Carson City. Primary data compilation occurred during the period of December 15, 1979 - January 15, 1980. Supplementary compilation occurred during the latter part of February 1980 to fill gaps and answer questions raised during data reduction and analysis.

Water rights are not static but dynamic. On a daily basis new applications are received, permits are issued, various proofs are filed, certificates are granted; waters rights are bought, leased, or abandoned; points and manner of diversion and use are changed. This inventory represents the situation as it existed during the above listed period. Not included in the inventory are the approximately 820 applications filed with the Nevada State Engineer between January 1, 1980 and March 31, 1980, of which

approximately 265 were in counties to be directly impacted by MX. It is unknown how many or which "rights" moved from application to permit status or permit to certificate status during this same period. Information sources at the Nevada Division of Water Resources which were utilized in the compilation of Water Rights Summaries were as follows:

1. Abstract files
2. Application Status Books
3. Application file folders/Certificate file folders
4. Township cards
5. Proof files
6. Miscellaneous; adjudications, field reports, etc.

Abstract Files - Water rights in most of Nevada's 232 hydrologic basins have at one time or other been summarized by the Division of Water Resources personnel. These summaries or "Abstracts" are filed in a common location. Because these abstracts were compiled by different people, at different times and for different purposes they differ greatly in completeness and perhaps in accuracy. In general once an abstract has been made it is not periodically updated to reflect changes in the status of water rights or addition of new rights. They are updated only on an as needed basis, generally associated with protests. Abstracts, if complete, contain the following information: Source, (underground or surface) Basin Name and Number, Date of Abstract, Application Number/Permit Number, Certificate Number, Owner of Record, Date of Priority, Point of Diversion, Rate of Diversion (cfs), Duty (AF/year), Use, Place of Use, and Remarks. A facsimile of the "Abstract of Water Filings" form as developed by the Division of Water Resources is shown in Figure 1. The actual forms are in an 8½" x 14" format. These forms were used in this inventory as an intermediate compilation tool for both Nevada and Utah data. In most cases for existing abstracts some or all of the

information in either the diversion rate, or duty column or both was missing and had to be estimated or calculated. For example if no duty were shown and the remarks column indicated that 160 acres were being irrigated then the duty was calculated on the basis of 4 feet per acre per year (or 5 feet in southern townships). Estimation techniques and assumptions are more fully explained in a following section. Since abstracts contain information only up to a given date (from about 6 months to 6 years prior to this inventory) they had to be updated by reference to the Application Status book.

Application Status Books - All applications for permits to appropriate water are given a number and entered numerically in the Application Status Book. This book is kept up to date on a daily basis and includes information such as the application number, date of filing application, the name and number of the hydrologic basin in which the water is to be diverted, and the dates on which various proofs are filed, permits and certificates are granted, dates of legal advertisement, etc. Rates of diversion, duties and annual rights, type of use etc., are not shown. In order to update an abstract it is necessary to begin at the application/permit number of the last entry on the abstract and proceed forward in the Application Status books to the current date listing all of the application numbers for the particular basin. Once these application numbers are listed, together with the date of filing (priority date) and owner of record and a check has been made to see that the application has not been withdrawn canceled or denied, one can proceed to the file room and obtain the application file folder. Approximately half of the applications that have been filed since filing procedures began in 1905 have been filed within the last 4 or 5 years. This is in part due to Desert Land Entry and Carrey Act applications. Therefore, abstracts only a year or so old required considerable updating. There are also a large number of applications on which action has not yet been taken.

Application File Folders/Certificate file folders - A folder is established for each application as it is received by the Division. All notices, proofs, permits, and correspondence pertaining to the application are filed in this folder. These records are usually the best and most complete source of information (once the appropriate folder has been located). At any given time several thousand of these folders may be signed out to various other locations within the office where they are somewhat difficult to obtain.

Township cards - The Division keeps a file of township cards, one for each township in the state. (Size approximately 12" to 12" ea). When an application is accepted by the office the location of the point of diversion and the place of use plotted on these cards. These cards can be used to determine the number and location of rights in a given area. These are not the best source of the information sought in this inventory because the cards are not always up to date and because the information is by township, not hydrologic basin.

Proof file - The proof file and the proof status book are difficult to use because entries are not filed by basin and one must know either the proof number, owner of record, name of source, or township, range and section location.

Miscellaneous - There are several other sources of information available at the Division of Water Resources office which were used for some basins. They include adjudications, filed reports, and personal comments from staff members. Official copies of all Proofs of Appropriation (Claims of vested rights), Permits, and Certificates are kept in leather bound volumes in the office safe. These records are not as complete and up to date as the Application file, however, they can be used if files cannot be located.

#### Utah

The State Engineer's Office has divided Utah into 45 areas for processing and filing water rights. These areas seldom coincide with the 60 hydrographic basins

defined by USGS in the state. These areas have been grouped into seven (7) field or "area offices". Those offices and the areas that they administer within the MX boundaries are:

<u>State Engineer's Areas</u>	<u>Area Office Location</u>
16, 17, 18	Salt Lake City
67, 68	Salina
69, 71	Cedar City

All paperwork pertinent to a particular right, from application to certification, are filed in the State Engineer's Office, Salt Lake City. A file is contained in a manila-type folder, grouped by area and stored on shelves in one room. Office workers can directly and easily remove the files, and as they are removed an outcard is inserted in its place. It is estimated that about 1 or 2 percent of the files were not available and had been replaced by outcards when the files were searched by DRI.

As applications are received by the State Engineer's Office they are located on plats and assigned an application number. When a file is made-up, a file number is assigned to the application number. File-application numbers are placed into books according to whether it is a surface water or a groundwater application. Thus, if one were to locate a groundwater right on a plat with its assigned application number, one could then locate the file number, and hence the file, by using the cataloged cross reference.

Many of the applications, and particularly the claims, were prepared by the individuals involved. Many of these are quite old. Usually they referred to a rate but not amount. But quite often the intended use would be listed, such as one family 0.25 acres irrigation, 25 sheep, 10 hogs, etc.

About 3,500 files were searched. Data were tape recorded for small flow rates (domestic, stock) and copied for the larger ones (irrigation, municipal, mining, geothermal). Copying efforts were slow and laborious, and only those rights within the MX area were copied or recorded.

## WATER RIGHTS DATA ANALYSIS

### Assumptions and Interpretations

As has been indicated, water rights in Nevada and Utah are in a continuous state of flux and this inventory represents the situation encountered during those periods DRI personnel were actually in the State Engineer's Offices of Nevada and Utah. Moreover, the water right data that reside in the files have been accumulating for over half a century. During this time the law has continued to evolve, administrative rules and regulations have changed, forms and office procedures have changed, and importantly, personnel have changed. As a consequence the type, manner and completeness of data recorded have changed. Thus, the process of reducing water right information contained in thousands of recorded instruments to a manageable and comprehensible state required exercise of considerable engineering judgement and interpretation. For example, how does one translate "3.2 cfs supplemental groundwater" to an annual irrigation water use, or "73 acres irrigated by spring flow" to either a diversion rate or annual use?

The assumptions made in this inventory are not certified by, agreed to, or approved by, either the State Engineer of Nevada or the State Engineer of Utah. However, all of the critical assumptions have been discussed with personnel from both those offices and to the maximum possible extent the procedures developed and used in those offices have been followed. For both States, the underlying principle that "Beneficial use shall be the basis, the measure and the limit of the right to the use of water . . . " (NRS 533.035 and UCA 73-1-3) was adhered to.

### Nevada

For purposes of granting permits and determining extent of beneficial use, the personnel in the Nevada Division of Water Resources use an internal working guide

listing appropriate "rules of thumb".<sup>1</sup> These rules, an abstract of which is given in Table 4, were followed whenever possible, but in all instances maximum available data were used to derive either or both the diversion rate or annual use. Further specific assumptions and procedures used are discussed in the following paragraphs. In all instances, if they were available, calculations made by the State Engineer's Office were given preference over DRI calculations based on the rules of thumb.

TABLE 4  
Nevada Beneficial Use Rules of Thumb

Irrigation: Amounts of Water Allowed on Permits

5.4 cfs	for	320 acres
4.7 cfs	"	280 "
4.0 cfs	"	240 "
3.4 cfs	"	200 "
2.7 cfs	"	160 "
2.4 cfs	"	120 "
1.7 cfs	"	80 "
1.0 cfs	"	40 "

Diversion x 1.983 x Days = Ac-ft per season

Duty for North Townships = 4 Ac-ft/ac/year

Duty for South Township = 5 Ac-ft/ac/year

Stock Watering: Duties

Cattle and Horses - 20 gpd = 0.00003125 cfs/head

Sheep - 4 gpd = 0.00000625 cfs/head

In some instances there was no information available as to the extent of an applied for water use. In these few cases the application was included under the appropriate use and ownership but with no associated diversion rate or annual use.

---

<sup>1</sup>This guide is referred to as the "Permit Terms Book" which is periodically amended by the State Engineer or Office Engineer. All personnel handling applications and permits have a copy of this guide.

Submittal of a deficient application establishes a priority date for the applicant provided additional data are provided within the time allowed to "correct" a "deficient" application.

Many "water rights" specify more than one type of water use, e.g., Irrigation and Stock, Irrigation and Domestic, Mining and Domestic, Stock and Wildlife, etc. In Nevada applications are limited to one source for one purpose, however individual domestic use may be included in any application with the other named use. In some cases this rule has not been enforced. In Utah an application can include more than one use. Most applications in Utah, therefore, specify several uses (ie, irrigation, stock watering, domestic). It is also common in Utah that water for residential landscape is included as irrigation water unlike in Nevada where it is considered as a component of domestic use. In all instances an attempt was made to categorize a "water right" on the basis of its primary use. In Nevada, secondary use (generally domestic) is usually minor compared to the primary use. In Utah the uses often tend to be more nearly equal.

Stockwatering - It was assumed that stockwatering, unless otherwise specified is a year-round requirement and thus if only a diversion rate were known the annual use in acre-feet was estimated at  $724 \frac{\text{ac-ft/yr}}{\text{cfs}} \times \text{Diversion rate (cfs)}$ . If both the diversion rate and number of head were known, the annual use was calculated with the rule of thumb. In only the number of head were known, both the diversion rate and annual use were calculated by the rule of thumb.

Irrigation - Unless sufficient data were available to modify water needs either upward or downward it was assumed that irrigation requirement was determined by climate and growing season only as reflected in established duties, i.e. soil conditions, water quality, and crop type were not considered. In each basin the first step was to examine certificated irrigation rights listed on the abstract to determine, if possible, the average

per acre diversion rate and annual duty. These numbers were given precedence over the rules of thumb to estimate missing data. If a calculated annual use, based on duty and known acreage, exceeded  $724 \times$  diversion rate in cfs, the annual use was reduced to the annual volumetric equivalent of the diversion rate with the implicit assumption that storage was available to accomplish this. In instances where supplemental groundwater rights were listed, the combined surface and groundwater diversion rates were summed, but the annual use was limited by the prevailing duty and acreage.

Domestic, Municipal and Mining - It was assumed that all of these water uses are year-around propositions and thus the annual use was calculated at  $724 \times$  diversion rate in cfs. In most instances there were no data available to warrant any other calculations. However, if there were they were always used.

Recreation - Most recreation uses were associated with surface impoundments and storage rights. Storage rights were summed in the annual use column but not in the diversion rate since most storage rights come from flows in excess of existing rights. For instream recreation, i.e., fisheries, the diversion rate was summed, but no annual use was calculated unless specific information was available to allow otherwise.

Wildlife - Most wildlife water use is for water fowl habitat and for deer and other large animals. It was assumed that these are year-around uses and thus the annual use was calculated at  $724 \times$  diversion rate in cfs.

Impoundment - Storage rights were assessed by using the impounded area, if available, and the annual evaporation rate.

## Utah

As in Nevada, the Utah State Engineer's Office uses rule of thumb in determining beneficial uses when an application is approved. These "rules of thumb" were discussed with personnel in the State Engineer's Office as to how they are applied. Table 5 is a listing of these. Whenever beneficial uses were specifically stated the annual use was calculated using the values in Table 5. Whenever flow rates only were applied for, or claimed, beneficial uses were assessed by judgement based upon the available facts.

TABLE 5  
Utah Beneficial Use Rules of Thumb

### Irrigation

1 cfs per 60 acres for water from wells  
Duty ranges from 3 to 5 ac-ft/ac/yr

### Stockwater

Cattle and horses - 25 gpd/head  
Sheep, goats and swine - 5 gpd/head  
Poultry - 0.75 gpd/bird

### Domestic and Household

650 gpd per family

## Significant Figures and Other Anomalies

### Significant Figures

One of the first things that college physics professors attempt to teach engineering students is the meaning and use of significant figures. Reference to any one of the "Hydrologic" and "Water Rights by Legal Status Summary" sheets will show that hydrologic data are given only to the nearest hundred or thousand (sometimes

10,000) acre feet, annual water use is given to the nearest acre foot and water right rates are given to the nearest  $10^{-3}$  to  $10^{-6}$  cfs. Why the disparity?

The hydrologic data are rounded to reflect lack of detailed knowledge of actually how much water is available on an average basis. Water rights are precisely defined quantities generally expressed in cubic feet per second though often in terms of gallons per minute. A water right for 10 gpm equals 0.022283+ cfs. Frequently small gpm rights are expressed in the water right documents in terms of their cfs equivalent to the nearest  $10^{-6}$  cfs. Given the number of approximations made to reduce the water rights data to the point shown in the Section II summary tables it may seem ludicrous to present sums to eight significant figures. This was done primarily to show that very small quantities of water are the subject of valid water rights. The water rights annual use figures are a compromise between representations of legal "fact" and hydrologic uncertainty and are the products of conversion of a "precise" rate to a derived quantity in different units.

#### Overappropriation

In many basins, particularly in Nevada, the aggregate groundwater and surface water annual use represented by Applications, Permits, Proofs and Certificate exceeds the estimated available water supply. If all applications and permits outstanding were to proceed to the Certificate stage and if all Proofs were to be adjudicated to the claimed use then these basins would truly be overappropriated. However, such is not likely to be the case. In most of these valleys the greatest significant volumes of water are associated with Applications for groundwater development. These Applications predominantly have been made in conjunction with applications under the Carey and Desert Land Entry Acts. As such they are being held in a "Ready for Action" status by the Nevada State Engineering pending release of those lands from the public domain. For example in basin N-173, Railroad Valley, the surface runoff plus perennial yield total only 101,000 af/y but the combined applications, permits, proofs and certificates

total 220,446 af/y. However, of this, 198,446 af/y are in the permit and application status. It seems unlikely that the State Engineer would do other than follow the State Water Law and thus would certificate water rights only to the approximate natural annual replenishment rate.

#### Reproducibility

A great deal of individual judgement was required in calculating values not shown on water rights forms. Since others attempting to reproduce these values might place differing degrees of importance on the various data available they would not necessarily end up with the same figures. Differences, however, should not be great. Since the process of filing for water rights has been in existence for about 75 years many different laws, regulations, policies and personal interpretation thereof have been in force in the State Engineer's Office. In calculating missing values for this inventory an attempt was made to consider both current procedures and historic procedures and to utilize the value which would most likely prevail if the right were to be reviewed by the State Engineer or the Court.

There are inconsistencies and anomalies in many water rights. For example in a Nevada valley containing both north and south townships there might be some crop acreage entitled to 4 feet of water per acre per year while adjacent crop acreage might be entitled to 5 feet per acre per year. In the same valley there may also be land entitled to 1.9 feet per acre per year based upon a no longer used duty for uncultivated natural pasture. In calculating a missing annual use in this valley one would have to consider the location of the place of use, the year that the right was granted, the original manner of use, etc.

Uncertainties were encountered in interpreting some rights. For example, a water right for mining and milling use or for industrial use might specify a large diversion rate. One could assume that some of the diverted water would be consumed and some returned to the surface and/or groundwater system. When the mining, milling

or industrial process was known a return flow was estimated and only the consumptive use included in the "Use" total. When no process information was known the entire amount of water diverted was considered to be consumed.

Uncertainties also were encountered with municipal supplies where the diversion rate was specified and no annual use figures were given. In these cases the specified rate was applied year round to obtain the annual use. This was done because it was believed that the system storage would handle some use variation and that investment in pumping equipment would probably not be much greater than absolutely necessary.

State Nevada

Basin Name Kobeh Valley

Basin No. N-139

NOTES:

1. This was one of the first basins summarized. Irrigation duty was assumed to be 3.5 ac-ft/ac based on length of growing season and amounts allowed for early certificates. A 4 ac-ft/ac duty would increase the certificated groundwater irrigation annual use by approximately 1154 ac-ft/year and permitted surface water irrigation by 80 ac-ft/year.

State Nevada

State Nevada

Basin Name Newark Valley

Basin No. N-154

NOTES:

1. This was one of the first basins summarized. Irrigation duty was assumed to be 3 ac-ft/ac based on length of growing season. If the 4 ac-ft/ac duty rule of thumb for north townships is used the Permitted groundwater irrigation annual use would be approximately 6480 ac-ft/yr greater and surface water Proof irrigation would be 35 ac-ft/yr greater. All irrigation is in private ownership.

State Nevada

Basin Name Hot Creek Valley

Basin No. N-156

NOTES:

1. For 13 groundwater Applications (Permits?) the rate, duty and use were not given in the abstract. Notation indicated all were associated with DLE thus they were assigned to irrigation of a total of 160 acres per application with diversion rate of 2.7 cfs and duty of 4 ac-ft/ac. Aggregate rate and annual use for these is thus 35.1 cfs and 8320 ac-ft/yr respectively.

Basin No. N-173

NOTES:

1. This is one of the first basins summarized. Irrigation duty was assumed to be 3 ac-ft/ac based on length of growing season. If the 4 ac-ft/ac duty rule of thumb for north townships is used the irrigation annual use totals would increase by approximately the following amounts:

Surface Water Applications & Permits	1,780 af/y
Surface Water Certificates & Proofs	3,096 af/y
Groundwater Applications & Permits	60,819 af/y
Groundwater Certificates & Proofs	<u>1,099 af/y</u>
Total	66,794 af/y

State Nevada

Basin Name Steptoe Valley

Basin No. N-179

Location: From T 10N to T 29N and R 61E to R 67E

\*Estimated Annual Surface Water Runoff 78,000 AFY

\*Estimated Annual Natural Groundwater Recharge 85,000 AFY

\*Estimated Annual Natural Groundwater Discharge 70,000 AFY

\*Estimated Perennial Groundwater Yield 70,000 AFY

\*Estimated Transitional Storage Reserve N/A AF

\*Source R42

State Nevada

Basin Name Pahranagat Valley

Basin No. N-209

NOTES:

1. In the following valleys within the MX area groundwater is believed to discharge to the deep carbonate system. Depth to groundwater is often great and perennial groundwater yield is limited by economics of pumping.

N-171 Coal Valley

N-172 Garden Valley

N-180 Cave Valley

N-181 Dry Lake Valley

N-182 Delamar Valley

N-206 Kane Springs Valley

N-207 White River Valley

N-209 Pahranagat Valley

2. Six groundwater permits were not included because of a lack of data in the Abstract by which to determine type of use, rate, duty or annual use.
3. Irrigation duty was based on 4 ac-ft/ac where acreage was indicated and where acreage was not given duty was based on the stated rate for 6 months.

State Utah

Basin Name Sevier Desert

Basin No. U-46

NOTES:

Rights for the major diversions from the Sevier River were not found in the State Engineer's files. Mr. Roger Walker, the Lower Sevier River Commissioner was interviewed and the following was ascertained:

1. The Sevier River has been adjudicated (Cox Decree)
2. Rights exceed the available surface flows-
  - a. Flows in the Sevier River near Delta average about 125,000 afy with a peak of about 175,000 afy.
  - b. About 77,000 acres have irrigation rights, but only 55,000 to 60,000 maximum have actually been farmed. Thus the available duty is about 2.27 acre-feet/acre.
3. Surface rights are supplemented by pumped groundwater.
4. Irrigation drainages flow to Topaz Slough and Sevier Lake.
5. Water quality of the Sevier River is poor as it has a total dissolved solids of more than 1,000 ppm. Groundwater is exclusively used for potable, stock, and small irrigation (family gardens) demands.

Chevron Oil Company is the major groundwater applicant. They have requested a diversion of 4,900 cfs of which 980 cfs is to be beneficially consumed for several electric power plants of 24 to 200 MW. The Fumarole Buttes, located about 15 miles northwest from Delta, is the area of diversion.

In compiling the groundwater rights, it was assumed that Chevron's annual diversion would be 4,900 cfs, but that their beneficial annual right would be equivalent to 980 cfs. The remaining 3,920 cfs to be returned to "... unknown at this time, but in vicinity of wells." Based upon a consumption of 980 cfs annually, 709,520 afy would be consumed. This represents about 76% of the total groundwater (applications and permits) compiled.

APPENDIX

March 17, 1960

Gerald Stoker  
Division of Water Rights  
P.O. Box 506  
Cedar City, UT 84720

Dear Mr. Stoker:

Please recall our telephone conversation this date concerning our efforts to compile water rights and to estimate hydrological conditions within the siting areas of the proposed MX system.

Enclosed is a copy of a map showing USGS basins within the Great Basin. I have marked the proposed MX area in Utah on the map (yellow color) and the numbers shown are USGS's.

Utah processes and files water rights by area which are numbered. We would like to define the Utah water-rights areas, in entirety, that are at least a part of the MX area. Please sketch these areas on the enclosed map and number them for us.

You may also be able to help us by estimating hydrological aspects of the valleys indicated by the USGS system or by the Utah areas. We are interested in the following information:

1. Estimated annual surface water runoff.
2. Estimated annual natural groundwater recharge.
3. Estimated annual natural groundwater discharge.
4. Estimated perennial groundwater yield.
5. Estimated transitional storage reserve.

I have enclosed two photocopied pages extracted from USGS professional paper 316-B which roughly defines perennial yield and transitional storage. This may be helpful for you, as I realize the information we are seeking is rather vague. As I mentioned on the phone, we have copies of State of Utah, DNR's Technical Publications 51 and 52 which cover USGS valleys 5 and 6. The rest of the area is unknown to us, and if you are aware of any reports which may help us, we would appreciate knowing about them. Assuming that nothing is available, we would appreciate your best guess.

We truly appreciate whatever help you can give us. I'll plan to call you during the week of the 31st, and we can discuss whatever problems or questions may arise.

Sincerely,

Donald Clark

BC/ke

For example, if about 160,000 acre-feet (197 hm<sup>3</sup>) of ground water were used for irrigation, roughly 25 percent, or 40,000 acre-feet (49 hm<sup>3</sup>), would be returned to the ground-water system by deep percolation. The net ground-water withdrawal thus would be 370,000 acre-feet (456 hm<sup>3</sup>) during years of minimum surface-water supplies. Some of the water withdrawn for industry, public supply, and other uses also probably would return to the ground-water body. Nevertheless, the net withdrawals still would be substantial and periodically would put a severe stress on the ground-water system. Ideally, the required well field or fields would be distributed and designed to minimize potential problems of local overdraft, depletion of flow in the lower reaches of streams and wetland areas, and local deterioration of water quality.

About 2 million acre-feet (2,470 hm<sup>3</sup>) of water is stored in the upper 100 feet (30 m) of saturated valley fill, so ample stored water is available to supply a deficit of 370,000 acre-feet (456 hm<sup>3</sup>) per year for several years. Withdrawals of this magnitude would last only during the dry periods and recovery probably could be expected during the intervening wet cycles. Recovery could be augmented by artificial recharge if necessary by utilizing excessive wet-period streamflow.

A system of this type also would be available to provide an emergency public supply during a disaster that might destroy or cause extensive damage to the surface-water-supply system.

#### DEVELOPMENT BY PUMPING GROUND WATER ONLY

##### WITHDRAWAL PLANNED TO MAINTAIN SOME NATURAL DISCHARGE

In many areas in the Great Basin Region, some natural ground-water discharge is beneficial. It may be desirable to maintain this discharge when the area is developed, particularly where extensive areas of wildlife habitat are sustained primarily by ground-water discharge. Ruby Valley, Nev., is an example of this type of area. The valley is a topographically closed basin about 60 miles (97 km) long and 8 to 12 miles (13 to 19 km) wide. It receives some subsurface inflow from adjacent Huntington Valley. Perennial yield is estimated to be about 58,000 acre-feet (72 hm<sup>3</sup>) per year, and each foot of dewatering throughout the valley-fill reservoir would provide about 33,000 acre-feet (41 hm<sup>3</sup>) of stored ground water. Because of these large quantities of water, the valley is classed among those with the highest potential for development (p. 17). However, a large marsh in the south half of the valley has been designated as the Ruby Lake National Wildlife Refuge. Almost half the ground-water resource is consumed by evapotranspiration in and near the Refuge. Any large-scale ground-water development would have to be strategically situated in the northern part of the valley, where pumping would have minimal effect on the marsh area. Consumptive use of the pumped water may eventually

have to be limited to an amount equal to evapotranspiration in the northern part of the valley that could be captured by pumping. Eakin and others (1951, p. 90) estimated that about 20,000 acre-feet (25 hm<sup>3</sup>) per year could be captured by pumping in the north end of the valley. If this water was used primarily for irrigation, perhaps one-third of the pumpage would not be consumed and would recirculate to the ground-water reservoir. Under these conditions, an annual pumpage of nearly 30,000 acre-feet (37 hm<sup>3</sup>) could be sustained in the northern part of the valley, and the Wildlife Refuge at the south end could be maintained at near-natural conditions. Detailed cause and effect studies would be required after some significant development, but before the valley approached full development. Analytical models of the ground-water reservoir would be useful in predicting long-term effects of pumping, including salt buildup from recycling, and in refining the initial estimate of allowable pumpage.

#### DEVELOPMENT DESIGNED TO CAPTURE ALL NATURAL DISCHARGE

Where ground water is the principal source of supply and availability of water is the limiting factor to development, it is desirable to plan developments so that all natural discharge will be captured. Ideally, this would involve siting wells strategically in and near areas of ground-water discharge so that the natural discharge could be captured with only minimal water-level declines and storage depletion. In reality, most ground-water discharge areas are associated with concentrations of poor-quality water and saline soils. Consequently, pumping generally should be located as strategically as possible within the constraints posed by water and soil conditions. Consumption of pumped ground water may eventually have to be limited to the amount of discharge that economically can be captured (the perennial yield). Temporary higher withdrawals are possible hydrologically but may result in legal problems. Regulation of pumpage is at the discretion of the appropriate State Engineer.

Hualapai Flat, Nev., is an area where this option has been employed. The area is a small topographically closed basin on the northwest flank of the Black Rock Desert. Perennial yield is about 6,700 acre-feet (8.3 hm<sup>3</sup>) per year, and each foot of dewatering of the valley-fill reservoir will provide about 3,500 acre-feet (4.3 hm<sup>3</sup>) of stored water. Intensive agricultural development began in about 1960 and by 1967 the gross annual pumpage was about 11,000 acre-feet (13.6 hm<sup>3</sup>) per year. However, only about two-thirds of the gross pumpage was consumed (7,400 acre-ft or 9.1 hm<sup>3</sup> per year) the remainder was recirculated to the ground-water reservoir (Harrell, 1969, p. 41). Allowing for some errors in estimates, the consumption of pumped water was about equal to the perennial yield. At this same time, a decision was made by the Nevada State Engineer to restrict development, and no per-

is to pump ground water for additional irrigated acres have been issued for several years. Pumping was started primarily with respect to land availability and good soil and is concentrated at one end of the valley. Ultimately, some pumping may have to be relocated in order to capture all available natural discharge. Also, problems in salt balance may develop in the pumping areas. However, regulation of pumpage early in the course of the area's development has probably minimized future problems and insured a moderate-sized, viable agricultural development for many years.

#### UTILIZATION OF GROUND-WATER STORAGE

Stored ground water is a valuable component of the region's water resource. There are about 300 million acre-feet (370,000 hm<sup>3</sup>) of recoverable water stored in the upper 300 feet (30 m) of saturated valley deposits. This water may be withdrawn as part of a planned depletion, it may be utilized principally during periods of drought or peak demand, or it may be held in reserve for possible future use.

#### USE AS A TRANSITIONAL RESERVE

This method of utilizing stored ground water is based on the concept that prior to any development a ground-water reservoir is in a state of dynamic equilibrium, where average recharge to the system equals average discharge, and there is no long-term change in storage. Any pumping will create an imbalance where water is pumped from storage until water levels decline sufficiently to cause natural discharge to decrease or recharge to increase and return the system to a new equilibrium where recharge equals natural discharge (if any) plus pumpage. In most desert valleys, there are no appreciable areas where recharge can be increased by pumping. If wells are strategically located in and near areas of natural discharge, the water that must be removed from storage before a new equilibrium can be obtained will be minimal. The minimal quantity of water that must be pumped from storage before an arid ground-water basin can attain a new equilibrium when developed at a rate equal to the perennial yield has been called the transitional storage reserve (Worts, 1967, p. 50). This quantity is a property of the ground-water basin and may be useful in long-term planning.

Diamond Valley, Nev., is an area where some planned storage depletion may be an option for the future. The valley is about 50 miles (80 km) long and averages about 12 miles (19 km) wide. All natural discharge is in the north half of the valley. Perennial yield is about 30,000 acre-feet (37 hm<sup>3</sup>) per year, and each foot of dewatering of the valley-fill reservoir will produce about 28,000 acre-feet (35 hm<sup>3</sup>) of stored water. Transitional storage reserve is about 1,400,000 acre-feet (1,730 hm<sup>3</sup>). The area has been developed for agricultural use. Permits to pump ground

water were issued for large tracts of land at the south end of the valley. In 1969 about 23,000 acre-feet (28 hm<sup>3</sup>) of water was pumped from this part of the valley. Future increases are anticipated because of increased demand for hay and grain and because of the recent availability of electric power in the area. Most of the pumping is at least 10 miles (16 km) south of the area of natural discharge and a local overdraft is probable before all natural discharge is captured by pumping from the present area of development.

One alternative in regulating storage depletion in the south end of the valley would be to allow a depletion equal to the transitional storage reserve to occur and then redistribute pumping with more regard to the natural system. If net pumpage (consumption) were held to 30,000 acre-feet (37 hm<sup>3</sup>) per year, the time required to deplete the storage can be approximated by the following formula (Worts, 1967, p. 52):

$$\text{Net annual pumping rate} = \frac{\text{Transitional storage reserve}}{\text{Time, in years}} + \frac{\text{Perennial yield}}{2}$$

For the Diamond Valley area, time equals about 93 years. Thus, water could be depleted from the south end of the valley at a rate of 30,000 acre-feet (37 hm<sup>3</sup>) per year for almost 100 years before the transitional storage reserve would be depleted. At that time it might be desirable to redistribute pumping as the average decline of non-pumping water levels in the south half of the valley would be about 100 feet (30 m); greater declines would be expected near centers of pumping. When a new equilibrium is finally attained, the total depletion of storage would only be slightly more than if the original pumping had been in or near the discharge areas. If desired, this same volume of storage could be depleted by pumping at a higher rate for a shorter period of time. After significant depletion has occurred, analytical models could be used to refine the initial estimates of time and to evaluate the optimum distribution of pumpage.

#### USE TO SUPPLY A TIME-LIMITED DEVELOPMENT

Ground water may be withdrawn at a rate greater than the perennial yield of the ground-water system for a limited period of time. This results in depletion of storage; however, it is not uncommon for an amount equal to several hundred times the perennial yield of the ground-water system to be stored at economically recoverable depths. Thus, in many areas, appreciable amounts of water might be removed from storage before seriously adverse economic effects occur. Ultimately, however, withdrawals would have to be limited to the approximate perennial yield of the ground-water system under the State laws or policies. Time-limited developments could be either (1) semipermanent developments, which could be economically terminated or reduced at the end of a given period of time, or (2) permanent developments,

RE: MX System, Utah

Dear Mr. Clark;

A change in my schedule allowed a brief research of the matter we discussed earlier and as related to your recent letter. We will address those areas of concern and hopefully answer your questions.

The green numbers on the enclosed map are the code numbers used by the Division of Water Rights in defining the hydrologic basins or subbasins as we know them. The policy for each basin will be briefly discussed on the attached summary sheet. We note that, generally, the USGS system agrees with our system for defining the basins although their numbers are different.

Apparently you have in your possession copies of the technical publications that I had in mind when we conversed earlier. Tech. Pub. 51 and 56 are the ones I had referred to but I will make another search through the library for others that might be pertinent.

The five areas that you refer to are going to be difficult to describe with any sense of accuracy:

1. Estimated annual surface water runoff - we have nothing in our files that would assist in this area.
2. Estimated annual natural groundwater recharge - The precipitation records from weather stations operated by various government agencies could give you a rough estimate of the potential recharge to the groundwater reservoir.

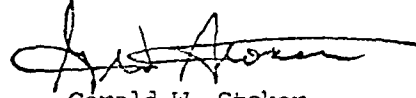

Page 2

RE: MX System, Utah

3. Estimated annual natural groundwater discharge - again, we have no record of the discharge from wells over the major portion of the area in question. Exceptions will be noted in the summary.
4. Estimated perennial groundwater yield and 5. Estimated transitional storage reserve also fall into the category of no information available at this time.

The summary is attached and should contain information that will answer some of the questions posed. Feel free to contact our office later for clarification to new or old questions.

Yours truly,

Gerald W. Stoker  
Area Engineer

GWS/bl  
attachment

Copy Sent to: Rex Larsen  
Salt Lake Office

- AREA 16 Skull Valley (aka Fish Spring Flat, Dugway Valley)  
Open to appropriation of water.  
Existing development is scattered throughout the area and involves several separate groundwater basins. The depth to water and the quality also vary throughout the basins.
- AREA 18 White Sage Valley (aka Pine Valley)  
Open to appropriation of water.  
Existing development is located near the south central of the basin and is still in the testing category. The depth to water is approximately 500 feet and the quality of the water is unknown. There are a few stockwatering wells scattered throughout the valley.
- AREA 19 Hamblin Valley (aka Tule Valley, Snake Valley)  
Open to appropriation of water, although the State Engineer is presently holding large applications in the south end of the basin. The groundwater table is approximately 200 to 300 feet deep and the water quality is generally good.
- AREA 68 Sevier Desert, Sevier Lake  
The area is generally open to appropriation of water, however, near the Delta area there are restrictions to the aquifers that can be developed. Since there are a number of separate and distinct aquifers the depth to water and the quality of water differ depending on the location.
- AREA 69 Wah Wah Valley  
Open to appropriation of water.  
Existing development under the alunit project in the southern portion of the valley. The groundwater table is approximately 600 feet deep and the water quality varies. Tech. Pub. 47 covers this valley in good detail.
- AREA 71 Escalante Valley, includes Milford Valley, Lund Area, & Beryl-Enterprise Area (aka Escalante Desert)  
Closed to appropriation of water.  
Heavily developed in the Beryl-Enterprise and Milford Areas and these basins have experienced declining groundwater tables. The USGS has also recorded subsidence in both areas and much of the detail is found in Tech. Pubs. 13 and 43.  
All future development must be accomplished through the transfer of existing water rights.
- AREA 73 Cedar City Valley (Escalante Desert)  
Area 75 Parowan Valley (Escalante Desert)  
Area 77 Beaver Valley (Escalante Desert)  
Closed to appropriation of water.  
Same policy as Area 71 except the subsidence problem.
